AKD 直观,功能强大的操作软件Workbench,使驱动器的设置,调试,编程更快速和简单

The screenshot displays the Kollmorgen Workbench software interface. The main window is titled "Kollmorgen Workbench - Beta Release" and features a menu bar (File, Edit, View, Tools, Help) and a toolbar with buttons for navigation and control (Enable, Stop, 0 - Service, 2 - Position Mode, Disable & Clear Faults, Save To Drive, Connect, Panic). A left-hand sidebar lists various configuration options such as Start Page, AKD Drive, no\_name (Offline)\*, Settings, Power, Feedback, Motor, Foldback, Brake, Units, Limits, Home, Current Loop, Velocity Loop, Position Loop, Service Motion, Encoder Emulatic, Analog Output, Digital I/O, Autotuner, Slider Tuning, Faults and Warnings, Scope, Parameter Load/Save, Parameters, and Terminal.

The main content area is titled "Settings" and includes a sub-header: "Select which mode of operation and command source the drive should work in. The AKD drive can work in many different modes, each mode is suited to different types of application." Below this, there are two dropdown menus: "Command Source:" set to "0 - Service" and "Operation Mode:" set to "2 - Position Mode".

A block diagram illustrates the control loop architecture. It shows a sequence of blocks: Home, Motion Task, Service Motion, Position Loop, Velocity Loop, Current Loop, Power, and Motor. A Feedback block is connected to the Motor and provides input to the Position Loop, Velocity Loop, and Current Loop. The diagram shows the flow of control signals from the Motion Task and Service Motion blocks through the Position Loop, Velocity Loop, and Current Loop to the Power block, which drives the Motor.

The status bar at the bottom indicates: Panic = Abort (F12), Drive Inactive, SW, HW, CS, No Faults, AKD-800306 (120/240 VAC 3A Drive), no\_name (Offline)\* - Offline. A small circular icon with the number 10 is located in the bottom right corner.

# AKD Workbench介绍

*Because Motion Matters.™*

The screenshot displays the Kollmorgen WorkBench software interface. The title bar reads "Kollmorgen WorkBench - Beta Release". The menu bar includes "File", "Edit", "View", "Tools", and "Help". Below the menu bar are several status buttons: "Enable", "Stop", "0 - Service", "2 - Position Mode", "Disable & Clear Faults", "Save To Drive", "Connect", and "Panic".

The left sidebar shows a tree view of the software's structure, including "Start Page", "AKD Drive", "no\_name (Offline)", "Settings", "Power", "Feedback", "Motor", "Foldback", "Brake", "Units", "Limits", "Home", "Current Loop", "Velocity Loop", "Position Loop", "Service Motion", "Encoder Emulatic", "Analog Output", "Digital I/O", "Autotuner", "Slider Tuning", "Faults and Warnings", "Scope", "Parameter Load/Save", "Parameters", and "Terminal".

The main area is titled "Settings" and contains the following text: "Select which mode of operation and command source the drive should work in. The AKD drive can work in many different modes, each mode is suited to different types of application." Below this text are two dropdown menus: "Command Source:" set to "0 - Service" and "Operation Mode:" set to "2 - Position Mode".

A block diagram illustrates the control loop. It starts with "Motion Task" and "Service Motion" blocks feeding into a "Position Loop" block. The "Position Loop" feeds into a "Velocity Loop", which feeds into a "Current Loop", which finally feeds into a "Power" block. The "Power" block drives a "Motor" (represented by a blue circle with an 'M'). A "Feedback" block receives input from the motor and feeds back into the "Position Loop", "Velocity Loop", and "Current Loop".

At the bottom of the interface, a status bar shows: "(F12) Drive Inactive SW HW CS No Faults AKD-B00306 (120/240 VAC 3A Drive) no\_name (Offline)™ - Offline ...".
